## ARICKS WHEEL RESIDUE MANAGERS

- Reduce Hair pinning
- Increase Germination
- Improve seed placement
- Ensure seed to soil contact
- Retain moisture
- Maintain soil carbon
- Reduce seed costs

No till seeding has become a popular choice amongst farmers in recent years and to help facilitate that nature of farming, the Aricks Residue manager was born. Retaining stubble is the aim and the result is preserving moisture, soil carbon, and biomatter. By temporarily sweeping the residue aside the disc has a clear path to cut a slot and ensure soil contact with seed placement. Designed to skim the surface through a depth setting, residue managers have also been used to incorporate chemicals through deeper engagement. Fitting seamlessly onto 60/90 and Proseries JD openers, they are an invaluable part of notill seeding practices.

The Original trial was to install one Aricks residue manager and gauge the results. As you can see from the adjacent photo, the continuity of germination in the middle row is a stark comparison to the rest.

The below photos are trials carried out on side by side rows with and without Aricks Wheels

One Aricks wheel in use
